

Pump and Motor sold separately

Axial Plunger Pumps

Direct-Drive Models 1LX100
1LX125
1LXXC100

Belt-Drive Model 1LXB100

FEATURES

- Low amp draw for compatibility with portable machines.
- Smooth, quiet operation for sound sensitive areas.
- Special Hi-Pressure and Lo-Pressure Seals offer exceptional life.
- RTP heat resistant liquid-end and Regulator.
- Mechanically actuated plungers offer greater efficiency.
- Optional direct-coupled motors for compact, easy assembly or convenient belt-drive mounting.
- Ready for initial start-up with oil in the crankcase.

INSTALLATION

Each pump comes with oil in the crankcase ready for start-up. CAT PUMPS special premium grade, multi-viscosity crankcase oil should be used.

It is recommended to install this pump in a horizontal position with the oil filler cap at the top. It is permissible to rotate the oil filler cap to the right or left, however, some oil spitting may occur. A rubber plug is inserted into the oil filler cap for shipping. This should be removed before operation. **Do not operate pump with plug in cap.**

Flexible hose should be installed at the unloader ports. Connect a hose equal to or one size larger than the inlet port at the **bottom** of the pump body. Connect a high pressure hose to the regulator discharge port at the **side of the regulator**. Connect a by-pass hose to the bottom port of the regulator or unloader and run to drain or back to a "T" in the inlet line.

CAUTION: Do not over tighten the RTP pump or regulator body.

OPERATION

Once the inlet water supply is turned on and the pump is started, adjust the regulator at the top with an allen wrench or turn adjusting cap on the unloader to set system pressure. Do this in small increments until the desired system operating pressure is reached.

The 1LX pumps are axial plunger pumps. Special direct-drive motors are secured to the pump with a V-Clamp Mounting. **The optional Drive Mount Assembly is required for the belt drive 1LXB100 model.**

SPECIFICATIONS

U.S. Measure

Metric Measure

MODELS 1LX100, 1LXB100, 1LXXC100

Flow1.0 GPM (3.8 L/M)
Stroke.....0.29" (7.4 mm)

MODEL 1LX125

By-Pass Ports (1).....1/4" NPTF (1/4" NPTF)
Discharge Ports (1).....1/4" NPTF (1/4" NPTF)
Discharge Fitting (1LXXC100 Only).....3/8" NPTF (3/8" NPTF)
Weight.....2.65 lbs. (1.2 kg)
Dimensions.....4.4 x 3.2 x 8.4" (112 x 81 x 212 mm)

ELECTRIC HORSEPOWER REQUIREMENTS

MODEL	FLOW		PRESSURE			RPM
			PSI 100	PSI 300	PSI 500	
	U.S. GPM	L/M	BAR 7	BAR 21	BAR 35	
1LX100, 1LXB100, 1LXXC100	1.0	3.8	.05	.20	.34	1725
1LX125	1.25	4.75	.08	.24	.42	1725

The motor rotates the offset cam and guide plate which is connected to the three plungers. Each plunger moves forward at a different stage of the cam rotation, providing a smooth, forward, liquid flow through the pump.

On the back stroke, the liquid enters the inlet chamber and flows through each inlet valve. As the forward stroke begins, the inlet valve closes.

On the forward stroke, the liquid goes through the seat and forces the discharge valve open to allow the liquid out the regulator discharge port.

"Customer confidence is our greatest asset"

SERVICE

This pump is designed for use with clean water. The seals and valves should last the life of the pump or 500 hour intervals. The Regulator or Unloader is a separate item and can be replaced/repared as needed.

Lubrication

Changing Crankcase Oil:

1. Shut down pump and remove from power source.
2. Remove black oil filler cap. Turn pump body over and drain.
3. Fill with exactly 2.23 oz. (66 ml) of CAT PUMPS crankcase oil and replace black oil filler cap.

NOTE: Change oil after each 500 hour interval.

Checking Oil Level:

1. Shut down pump and remove from power source.
2. Remove black oil filler cap.
3. Place dipstick in pump with one (1) flattened end into crankcase and the other flattened edge flush with top of the port.
NOTE: All models come with a dipstick.
4. Remove dipstick. Oil level should be at the top of the lower flattened rod.
5. Adjust oil level as needed. Replace black oil filler cap.

Seals and Valves

Disassembly:

1. Remove all hoses from the pump.
2. Remove oil filler cap and drain the oil from the crankcase.
3. Remove three manifold screws.
4. Remove manifold and crankcase from the crankcase cover.
NOTE: Cam and bearings will remain in crankcase cover. Thrust bearing will be a loose part.
5. Separate the manifold from the crankcase.
NOTE: Guide plate, plunger, plunger rod, plunger retainer, ball, spring, washer and oil seal will remain in crankcase.
6. Remove seal retainer from each crankcase chamber.
7. Remove the Lo-Pressure Seal (LPS) and then seal case from each manifold chamber.
8. Remove washer and Hi-Pressure Seal (HPS) from each cylinder.
9. Using a reverse pliers, remove the cylinder from each manifold chamber.
CAUTION: Exercise caution as the reverse pliers may score HPS surface.
10. Separate the inlet/discharge seat from the cylinder.
11. Remove the inlet valve, o-ring and inlet spring from the each cylinder.
12. Using a pliers, remove discharge valve and spring from each manifold chamber.

Reassembly:

1. Examine the discharge valves and springs for wear and replace as needed. Snap spring to each discharge valve.
2. Using a pliers, insert the discharge valve/spring assembly into the notches at the bottom of the manifold.
3. Examine the inlet/discharge seats for wear and replace as needed. Install new o-rings onto both ends of the inlet/discharge seats.
4. Examine the inlet valves and springs for wear and replace as needed.
5. Examine cylinders for wear and replace as needed.
6. Install inlet spring, then valve into each cylinder.
7. Lubricate the outer surface of both o-rings on each inlet/discharge seat, then press inlet/discharge seat into each cylinder.
8. Press inlet/discharge seat and cylinder assembly into manifold chamber.
9. Examine HPS and replace as needed. Press HPS into each cylinder with groove down.
10. Examine washer and replace as needed. Press washer into each cylinder with beveled edge down.
11. Examine seal case and replace as needed. Press seal case into each manifold chamber.
12. Examine LPS and replace as needed. Press LPS into each seal case with groove down.
13. Examine seal retainer for wear and replace as needed. Install seal retainer into each crankcase chamber.
14. Place hand over the end of the plunger guide plate to keep the ball, spring and washer contained within the crankcase. Press crankcase into manifold.
15. Place manifold and crankcase assemblies into the crankcase cover.
16. Insert the three manifold screws and torque to 30 in/lbs.
17. Fill per instructions under CHANGING CRANKCASE OIL, Step 3.

TORQUE CHART

Item	Size	in.lbs.	Nm
Pump Inlet	1/2"	25	3
Unloader Discharge	1/4"	50	6
Unloader By-Pass	1/4"	25	3
Manifold Screw	M6x90	31	3.5
Clamp Screw	10-32	20	2.4

Model 7550 Shown

- 1 High strength, lightweight, die cast aluminum **crankcase**.
- 2 Direct coupled, **clamp mounting** for easy, compact assembly and disassembly.
- 3 360° guided, mechanically actuated **plungers** offer precise flow with greater efficiency.
- 4 Spring reinforced **oil seal** separates crankcase from liquid end and allows easy maintenance of Lo-Pressure and Hi-Pressure Seals.
- 5 CAT PUMP exclusive, **Hi-Pressure Seals** offer exceptional performance and unmatched seal life with high temperature liquids.
- 6 Spring guided **inlet valve** design offers positive seating and a smooth, consistent flow.
- 7 Lightweight, heat-resistant RTP **liquid end** and **Regulator** offer extended life.
- 8 Easy access **adjusting screw** for precise pressure adjustment and servicing.
- 9 Ultra **compact design** and threaded back port permits direct mounting on manifold head.
- 10 RTP heat and chemical resistant **body**.
- 11 Stainless Steel **piston and seat** for multiple cycle durability.
- 12 Bottom **by-pass port** redirects liquid if discharge line becomes blocked protecting pump from over pressure.
